Lawn & Tree Care

Organic Fertilizer Fact Sheet

Organic Fertilizer can have benefits in some areas that traditional chemical fertilizers don't. While good to excellent results from chemical based fertilizer are to be expected with proper application and blending choices, organics have some strong advantages.

They can:

- * Improve soil over time if used regularly
- * Balance soil PH
- * Fight some diseases and suppress damage from others
- * Add natural micro nutrients not present in poor soil

In our area natural fertilizers can have positive effects controlling many diseases including Necrotic Ring Spot. Though not a cure, organic based fertilizer can help reduce or even reverse damage. Also, with organic fertilizer other spring and summer disease such as Red Thread, Helminthosporium and Rhizoctonia can be lessened and even eliminated.

The down side of organic is that if its longevity is shortened by heat & moisture, so effects of the application is shortened. We've developed a program that brings the benefits of organics with superior color that lasts six to eight weeks. We include weed control as needed to give a green healthy weed free lawn.

Our Organic Program is very popular. With proper watering and mowing the result is excellent over time. We recommend it for anyone, but especially Necrotic lawns or lawns in clay or sandy soils.

Please remember proper mowing and watering is very important. Always follow your Living Water technician's recommendations for best results with any Living Water Program.

Give us a call at 1-800-LAWNCARE if you have any questions.

Commit your work to the Lord & it will succeed - Proverbs 16:3
