## Organic Thatch Reducer

Organic gardeners and horticultural professionals know that one of the secrets to having a **GREAT** lawn is to have great soil. This means a porous, well aerated soil where roots can grow deeply and thrive.

Aeration will open up the roots of the turf and will allow the organic de-thatch to penetrate deep into the roots of the plants. Organic de-thatching helps save water, reduce plant stress and disease, and improves air and water penetration.

We recommend that Organic de-thatch be used at least twice a year on your lawn and should be used in conjunction with one aeration per year. This will help eliminate up to 1" of thatch from your lawn.

We do not recommend mechanical de-thatching, because of how hard this is on the root system of the turf and it pulls out the good turf along with the layer of thatch.
